Introduction

PHPWord is a library written in pure PHP that provides a set of classes to write to and read from different document file formats. The current version of PHPWord supports Microsoft Office Open XML (OOXML or OpenXML), OASIS Open Document Format for Office Applications (OpenDocument or ODF), and Rich Text Format (RTF).

PHPWord is an open source project licensed under the terms of LGPL version 3. PHPWord is aimed to be a high quality software product by incorporating continuous integration and unit testing. You can learn more about PHPWord by reading this Developers' Documentation and the API Documentation.

1.1 Features

- Set document properties, e.g. title, subject, and creator.
- · Create document sections with different settings, e.g. portrait/landscape, page size, and page numbering
- Create header and footer for each sections
- Set default font type, font size, and paragraph style
- Use UTF-8 and East Asia fonts/characters
- Define custom font styles (e.g. bold, italic, color) and paragraph styles (e.g. centered, multicolumns, spacing) either as named style or inline in text
- Insert paragraphs, either as a simple text or complex one (a text run) that contains other elements
- Insert titles (headers) and table of contents
- Insert text breaks and page breaks
- Insert right-to-left text
- Insert and format images, either local, remote, or as page watermarks
- Insert binary OLE Objects such as Excel or Visio
- Insert and format table with customized properties for each rows (e.g. repeat as header row) and cells (e.g. background color, rowspan, colspan)
- · Insert list items as bulleted, numbered, or multilevel
- Insert hyperlinks
- · Insert footnotes and endnotes
- Insert drawing shapes (arc, curve, line, polyline, rect, oval)
- Insert charts (pie, doughnut, bar, line, area, scatter, radar)

- Insert form fields (textinput, checkbox, and dropdown)
- Create document from templates
- Use XSL 1.0 style sheets to transform main document part of OOXML template
- ... and many more features on progress

1.2 File formats

Below are the supported features for each file formats.

1.2.1 Writers

Features		DOCX	ODT	RTF	HTML	PDF
Document Properties	Standard					
	Custom					
Element Type	Text					
	Text Run					
	Title					
	Link					
	Preserve Text					
	Text Break					
	Page Break					
	List					
	Table					
	Image					
	Object					
	Watermark					
	Table of Contents					
	Header					
	Footer					
	Footnote					
	Endnote					
Graphs	2D basic graphs					
	2D advanced graphs					
	3D graphs					
Math	OMML support					
	MathML support					
Bonus	Encryption					
	Protection					

1.2.2 Readers

Features		DOCX	DOC	ODT	RTF	HTML

	Protection					

1.3 Contributing

We welcome everyone to contribute to PHPWord. Below are some of the things that you can do to contribute.

- Read our contributing guide.
- Fork us and request a pull to the develop branch.
- Submit bug reports or feature requests to GitHub.
- Follow @PHPWord and @PHPOffice on Twitter.

1.3. Contributing 5

Installing/configuring

2.1 Requirements

Mandatory:

- PHP 5.3+
- PHP Zip extension
- PHP XML Parser extension

Optional PHP extensions:

- GD
- XMLWriter
- XSL

2.2 Installation

There are two ways to install PHPWord, i.e. via Composer or manually by downloading the library.

2.2.1 Using Composer

To install via Composer, add the following lines to your composer.json:

```
{
    "require": {
        "phpoffice/phpword": "dev-master"
    }
}
```

If you are a developer or if you want to help us with testing then fetch the latest branch for developers. Notice: All contributions must be done against the developer branch.

```
{
    "require": {
        "phpoffice/phpword": "dev-develop"
    }
}
```

2.2.2 Manual install

To install manually, you change to the webserver directory of your file system. Then you have 2 possibilities.

- download PHPWord package from github.
 Extract the package and put the contents to your machine.
- 2. Alternatively you can use Git to install it:

```
git clone https://github.com/PHPOffice/PHPWord.git
```

To use the library, include src/PhpWord/Autoloader.php in your PHP script and invoke Autoloader:register.

```
require_once '/path/to/src/PhpWord/Autoloader.php';
\PhpOffice\PhpWord\Autoloader::register();
```

2.3 Using samples

After installation, you can browse and use the samples that we've provided, either by command line or using browser. If you can access your PHPWord library folder using browser, point your browser to the samples folder, e.g. http://localhost/PhpWord/samples/.

General usage

3.1 Basic example

The following is a basic example of the PHPWord library. More examples are provided in the samples folder.

```
<?php
require_once 'src/PhpWord/Autoloader.php';
\PhpOffice\PhpWord\Autoloader::register();
// Creating the new document...
$phpWord = new \PhpOffice\PhpWord\PhpWord();
/* Note: any element you append to a document must reside inside of a Section. */
// Adding an empty Section to the document...
$section = $phpWord->addSection();
// Adding Text element to the Section having font styled by default...
$section->addText(
   htmlspecialchars(
        '"Learn from yesterday, live for today, hope for tomorrow. '
            . 'The important thing is not to stop questioning." '
            . '(Albert Einstein)'
    )
);
* Note: it's possible to customize font style of the Text element you add in three ways:
* - inline;
 * - using named font style (new font style object will be implicitly created);
 * - using explicitly created font style object.
// Adding Text element with font customized inline...
$section->addText(
   htmlspecialchars(
        '"Great achievement is usually born of great sacrifice, '
            . 'and is never the result of selfishness." '
            . '(Napoleon Hill)'
    array('name' => 'Tahoma', 'size' => 10)
);
// Adding Text element with font customized using named font style...
```

```
$fontStyleName = 'oneUserDefinedStyle';
$phpWord->addFontStyle(
    $fontStyleName,
    array('name' => 'Tahoma', 'size' => 10, 'color' => '1B2232', 'bold' => true)
);
$section->addText(
   htmlspecialchars(
        '"The greatest accomplishment is not in never falling, '
            . 'but in rising again after you fall." '
            . '(Vince Lombardi)'
    $fontStyleName
);
// Adding Text element with font customized using explicitly created font style object. .
$fontStyle = new \PhpOffice\PhpWord\Style\Font();
$fontStyle->setBold(true);
$fontStyle->setName('Tahoma');
$fontStyle->setSize(13);
$myTextElement = $section->addText(
   htmlspecialchars('"Believe you can and you\'re halfway there." (Theodor Roosevelt)')
);
$myTextElement->setFontStyle($fontStyle);
// Saving the document as OOXML file...
$objWriter = \PhpOffice\PhpWord\IOFactory::createWriter($phpWord, 'Word2007');
$objWriter->save('helloWorld.docx');
// Saving the document as ODF file...
$objWriter = \PhpOffice\PhpWord\IOFactory::createWriter($phpWord, 'ODText');
$objWriter->save('helloWorld.odt');
// Saving the document as HTML file...
$objWriter = \PhpOffice\PhpWord\IOFactory::createWriter($phpWord, 'HTML');
$objWriter->save('helloWorld.html');
/* Note: we skip RTF, because it's not XML-based and requires a different example. */
/* Note: we skip PDF, because "HTML-to-PDF" approach is used to create PDF documents. *
```

3.2 Settings

The PhpOffice\PhpWord\Settings class provides some options that will affect the behavior of PHPWord. Below are the options.

3.2.1 XML Writer compatibility

This option sets XMLWriter::setIndent and XMLWriter::setIndentString. The default value of this option is true (compatible), which is required for OpenOffice to render OOXML document correctly. You can set this option to false during development to make the resulting XML file easier to read.

```
\PhpOffice\PhpWord\Settings::setCompatibility(false);
```

3.2.2 Zip class

By default, PHPWord uses Zip extension to deal with ZIP compressed archives and files inside them. If you can't have Zip extension installed on your server, you can use pure PHP library alternative, PclZip, which included with PHPWord.

```
\PhpOffice\PhpWord\Settings::setZipClass(\PhpOffice\PhpWord\Settings::PCLZIP);
```

3.3 Default font

By default, every text appears in Arial 10 point. You can alter the default font by using the following two functions:

```
$phpWord->setDefaultFontName('Times New Roman');
$phpWord->setDefaultFontSize(12);
```

3.4 Document information

You can set the document information such as title, creator, and company name. Use the following functions:

```
$properties = $phpWord->getDocInfo();
$properties->setCreator('My name');
$properties->setCompany('My factory');
$properties->setTitle('My title');
$properties->setDescription('My description');
$properties->setCategory('My category');
$properties->setLastModifiedBy('My name');
$properties->setCreated(mktime(0, 0, 0, 3, 12, 2014));
$properties->setModified(mktime(0, 0, 0, 3, 14, 2014));
$properties->setSubject('My subject');
$properties->setKeywords('my, key, word');
```

3.5 Measurement units

The base length unit in Open Office XML is twip. Twip means "TWentieth of an Inch Point", i.e. 1 twip = 1/1440 inch.

You can use PHPWord helper functions to convert inches, centimeters, or points to twips.

3.3. Default font

Containers

Containers are objects where you can put elements (texts, lists, tables, etc). There are 3 main containers, i.e. sections, headers, and footers. There are 3 elements that can also act as containers, i.e. textruns, table cells, and footnotes.

4.1 Sections

Every visible element in word is placed inside of a section. To create a section, use the following code:

```
$section = $phpWord->addSection($sectionStyle);
```

The \$sectionStyle is an optional associative array that sets the section. Example:

```
$sectionStyle = array(
    'orientation' => 'landscape',
    'marginTop' => 600,
    'colsNum' => 2,
);
```

4.1.1 Page number

You can change a section page number by using the pageNumberingStart style of the section.

```
// Method 1
$section = $phpWord->addSection(array('pageNumberingStart' => 1));

// Method 2
$section = $phpWord->addSection();
$section->getStyle()->setPageNumberingStart(1);
```

4.1.2 Multicolumn

You can change a section layout to multicolumn (like in a newspaper) by using the breakType and colsNum style of the section.

```
// Method 1
$section = $phpWord->addSection(array('breakType' => 'continuous', 'colsNum' => 2));

// Method 2
$section = $phpWord->addSection();
```

```
$section->getStyle()->setBreakType('continuous');
$section->getStyle()->setColsNum(2);
```

4.1.3 Line numbering

You can apply line numbering to a section by using the lineNumbering style of the section.

```
// Method 1
$section = $phpWord->addSection(array('lineNumbering' => array()));

// Method 2
$section = $phpWord->addSection();
$section->getStyle()->setLineNumbering(array());
```

Below are the properties of the line numbering style.

- start Line numbering starting value
- increment Line number increments
- distance Distance between text and line numbering in twip
- restart Line numbering restart setting continuouslnewPagelnewSection

4.2 Headers

Each section can have its own header reference. To create a header use the addHeader method:

```
$header = $section->addHeader();
```

Be sure to save the result in a local object. You can use all elements that are available for the footer. See "Footer" section for detail. Additionally, only inside of the header reference you can add watermarks or background pictures. See "Watermarks" section.

4.3 Footers

Each section can have its own footer reference. To create a footer, use the addFooter method:

```
$footer = $section->addFooter();
```

Be sure to save the result in a local object to add elements to a footer. You can add the following elements to footers:

- Texts addText and createTextrun
- · Text breaks
- Images
- Tables
- · Preserve text

See the "Elements" section for the detail of each elements.

4.4 Other containers

Textruns, table cells, and footnotes are elements that can also act as containers. See the corresponding "Elements" section for the detail of each elements.

4.4. Other containers

Elements

Below are the matrix of element availability in each container. The column shows the containers while the rows lists the elements.

Num	Element	Section	Header	Footer	Cell	Text Run	Footnote
1	Text	v	v	V	v	V	v
2	Text Run	v	V	V	v	•	•
3	Link	v	v	v	V	V	V
4	Title	v	?	?	?	?	?
5	Preserve Text	?	V	V	V*	•	•
6	Text Break	V	V	V	V	V	V
7	Page Break	v	•	•	•	•	•
8	List	V	V	V	V	•	•
9	Table	V	v	v	V	•	•
10	Image	V	v	V	V	V	V
11	Watermark	•	V	•	•	•	•
12	Object	v	V	V	V	V	V
13	TOC	v	•	•	•	•	•
14	Footnote	V	•	•	V**	V**	•
15	Endnote	V	•	•	V**	V**	•
16	CheckBox	V	V	V	V	•	•
17	TextBox	v	v	V	v	•	•
18	Field	V	v	V	V	V	v
19	Line	v	V	v	v	V	V

Legend:

- v Available
- v* Available only when inside header/footer
- v** Available only when inside section
- - Not available
- ? Should be available

5.1 Texts

Text can be added by using addText and addTextRun method. addText is used for creating simple paragraphs that only contain texts with the same style. addTextRun is used for creating complex paragraphs that contain text with different style (some bold, other italics, etc) or other elements, e.g. images or links. The syntaxes are as follow:

```
$section->addText($text, [$fontStyle], [$paragraphStyle]);
$textrun = $section->addTextRun([$paragraphStyle]);
```

5.1.1 Text styles

You can use the \$fontStyle and \$paragraphStyle variable to define text formatting. There are 2 options to style the inserted text elements, i.e. inline style by using array or defined style by adding style definition.

Inline style examples:

```
$fontStyle = array('name' => 'Times New Roman', 'size' => 9);
$paragraphStyle = array('align' => 'both');
$section->addText('I am simple paragraph', $fontStyle, $paragraphStyle);

$textrun = $section->addTextRun();
$textrun->addText('I am bold', array('bold' => true));
$textrun->addText('I am italic', array('italic' => true));
$textrun->addText('I am colored', array('color' => 'AACCOO'));
```

Defined style examples:

```
$fontStyle = array('color' => '006699', 'size' => 18, 'bold' => true);
$phpWord->addFontStyle('fStyle', $fontStyle);
$text = $section->addText('Hello world!', 'fStyle');

$paragraphStyle = array('align' => 'center');
$phpWord->addParagraphStyle('pStyle', $paragraphStyle);
$text = $section->addText('Hello world!', 'pStyle');
```

Font style

Available font styles:

- name Font name, e.g. Arial
- size Font size, e.g. 20, 22,
- hint Font content type, default, eastAsia, or cs
- bold Bold, true or false
- italic Italic, true or false

- superScript Superscript, true or false
- subScript Subscript, true or false
- underline Underline, dash, dotted, etc.
- strikethrough Strikethrough, true or false
- doubleStrikethrough Double strikethrough, true or false
- color Font color, e.g. FF0000
- fgColor Font highlight color, e.g. yellow, green, blue
- bgColor Font background color, e.g. FF0000
- smallCaps Small caps, true or false
- allCaps All caps, true or false

Paragraph style

Available paragraph styles:

- align Paragraph alignment, *left*, *right* or *center*
- spaceBefore Space before paragraph
- spaceAfter Space after paragraph
- indent Indent by how much
- hanging Hanging by how much
- basedOn Parent style
- next Style for next paragraph
- widowControl Allow first/last line to display on a separate page, true or false
- keepNext Keep paragraph with next paragraph, true or false
- keepLines Keep all lines on one page, true or false
- pageBreakBefore Start paragraph on next page, true or false
- lineHeight text line height, e.g. 1.0, 1.5, ect...
- tabs Set of custom tab stops

5.1.2 Titles

If you want to structure your document or build table of contents, you need titles or headings. To add a title to the document, use the addTitleStyle and addTitle method.

```
$phpWord->addTitleStyle($depth, [$fontStyle], [$paragraphStyle]);
$section->addTitle($text, [$depth]);
```

Its necessary to add a title style to your document because otherwise the title won't be detected as a real title.

5.1. Texts 19

5.1.3 Links

You can add Hyperlinks to the document by using the function addLink:

```
$section->addLink($linkSrc, [$linkName], [$fontStyle], [$paragraphStyle]);
```

- \$linkSrc The URL of the link.
- \$linkName Placeholder of the URL that appears in the document.
- \$fontStyle See "Font style" section.
- \$paragraphStyle See "Paragraph style" section.

5.1.4 Preserve texts

The addPreserveText method is used to add a page number or page count to headers or footers.

```
$footer->addPreserveText('Page {PAGE} of {NUMPAGES}.');
```

5.2 Breaks

5.2.1 Text breaks

Text breaks are empty new lines. To add text breaks, use the following syntax. All paramaters are optional.

```
$section->addTextBreak([$breakCount], [$fontStyle], [$paragraphStyle]);
```

- \$breakCount How many lines
- \$fontStyle See "Font style" section.
- \$paragraphStyle See "Paragraph style" section.

5.2.2 Page breaks

There are two ways to insert a page breaks, using the addPageBreak method or using the pageBreakBefore style of paragraph.

```
:: code-block:: php
```

\\$section->addPageBreak();

5.3 Lists

To add a list item use the function addListItem.

Basic usage:

```
$section->addListItem($text, [$depth], [$fontStyle], [$listStyle], [$paragraphStyle]);
```

Parameters:

• \$text Text that appears in the document.

- \$depth Depth of list item.
- \$fontStyle See "Font style" section.
- \$listStyle List style of the current element TYPE_NUMBER, TYPE_ALPHANUM, TYPE_BULLET_FILLED, etc. See list of constants in PHPWord_Style_ListItem.
- \$paragraphStyle See "Paragraph style" section.

Advanced usage:

You can also create your own numbering style by changing the \$listStyle parameter with the name of your numbering style.

```
$phpWord->addNumberingStyle(
    'multilevel',
    array('type' => 'multilevel', 'levels' => array(
        array('format' => 'decimal', 'text' => '%1.', 'left' => 360, 'hanging' => 360, 'tabPos' => 360, '
```

Level styles:

- start Starting value
- format Numbering format bullet/decimal/upperRomanllowerRomanlupperLetter/lowerLetter
- restart Restart numbering level symbol
- suffix Content between numbering symbol and paragraph text tablspacelnothing
- text Numbering level text e.g. %1 for nonbullet or bullet character
- align Numbering symbol align leftlcenterlrightlboth
- left See paragraph style
- hanging See paragraph style
- tabPos See paragraph style
- font Font name
- hint See font style

5.4 Tables

To add tables, rows, and cells, use the addTable, addRow, and addCell methods:

```
$table = $section->addTable([$tableStyle]);
$table->addRow([$height], [$rowStyle]);
$cell = $table->addCell($width, [$cellStyle]);
```

Table style can be defined with addTableStyle:

5.4. Tables 21

```
$tableStyle = array(
    'borderColor' => '006699',
    'borderSize' => 6,
    'cellMargin' => 50
);
$firstRowStyle = array('bgColor' => '66BBFF');
$phpWord->addTableStyle('myTable', $tableStyle, $firstRowStyle);
$table = $section->addTable('myTable');
```

5.4.1 Table, row, and cell styles

Table styles:

- width Table width in percent
- bgColor Background color, e.g. '9966CC'
- border (Top|Right|Bottom|Left) Size Border size in twips
- border (Top|Right|Bottom|Left)Color Border color, e.g. '9966CC'
- cellMargin (Top|Right|Bottom|Left) Cell margin in twips

Row styles:

- tblHeader Repeat table row on every new page, true or false
- cantSplit Table row cannot break across pages, true or false
- exactHeight Row height is exact or at least

Cell styles:

- width Cell width in twips
- valign Vertical alignment, top, center, both, bottom
- textDirection Direction of text
- bgColor Background color, e.g. '9966CC'
- border (Top|Right|Bottom|Left) Size Border size in twips
- border (Top|Right|Bottom|Left) Color Border color, e.g. '9966CC'
- gridSpan Number of columns spanned
- vMerge restart or continue

5.4.2 Cell span

You can span a cell on multiple columns by using gridSpan or multiple rows by using vMerge.

```
$cell = $table->addCell(200);
$cell->getStyle()->setGridSpan(5);
```

See Sample_09_Tables.php for more code sample.

5.5 Images

To add an image, use the addImage method to sections, headers, footers, textruns, or table cells.

```
$section->addImage($src, [$style]);
```

- source String path to a local image or URL of a remote image
- styles Array fo styles for the image. See below.

Examples:

```
$section = $phpWord->addSection();
$section->addImage(
    'mars.jpg',
    array(
        'width' => 100,
        'height' => 100,
        'marginTop' => -1,
        'marginLeft' => -1,
        'wrappingStyle' => 'behind'
    )
);
$footer = $section->addFooter();
$footer->addImage('http://example.com/image.php');
$textrun = $section->addTextRun();
$textrun->addImage('http://php.net/logo.jpg');
```

5.5.1 Image styles

Available image styles:

- width Width in pixels
- height Height in pixels
- align Image alignment, left, right, or center
- marginTop Top margin in inches, can be negative
- marginLeft Left margin in inches, can be negative
- wrappingStyle Wrapping style, inline, square, tight, behind, or infront

5.5.2 Watermarks

To add a watermark (or page background image), your section needs a header reference. After creating a header, you can use the addWatermark method to add a watermark.

```
$section = $phpWord->addSection();
$header = $section->addHeader();
$header->addWatermark('resources/_earth.jpg', array('marginTop' => 200, 'marginLeft' => 55));
```

5.5. Images 23

5.6 Objects

You can add OLE embeddings, such as Excel spreadsheets or PowerPoint presentations to the document by using addObject method.

```
$section->addObject($src, [$style]);
```

5.7 Table of contents

To add a table of contents (TOC), you can use the addTOC method. Your TOC can only be generated if you have add at least one title (See "Titles").

```
$section->addTOC([$fontStyle], [$tocStyle], [$minDepth], [$maxDepth]);
```

- \$fontStyle: See font style section
- \$tocStyle: See available options below
- \$minDepth: Minimum depth of header to be shown. Default 1
- \$maxDepth: Maximum depth of header to be shown. Default 9

Options for \$tocStyle:

- tabLeader Fill type between the title text and the page number. Use the defined constants in PHP-Word_Style_TOC.
- tabPos The position of the tab where the page number appears in twips.
- indent The indent factor of the titles in twips.

5.8 Footnotes & endnotes

You can create footnotes with addFootnote and endnotes with addEndnote in texts or textruns, but it's recommended to use textrun to have better layout. You can use addText, addLink, addTextBreak, addImage, addObject on footnotes and endnotes.

On textrun:

```
$textrun = $section->addTextRun();
$textrun->addText('Lead text.');
$footnote = $textrun->addFootnote();
$footnote->addText('Footnote text can have ');
$footnote->addLink('http://test.com', 'links');
$footnote->addText('.');
$footnote->addTextBreak();
$footnote->addTextBreak();
$footnote->addText('And text break.');
$textrun->addText('Trailing text.');
$endnote = $textrun->addEndnote();
$endnote->addText('Endnote put at the end');
```

On text:

```
$section->addText('Lead text.');
$footnote = $section->addFootnote();
$footnote->addText('Footnote text.');
```

The footnote reference number will be displayed with decimal number starting from 1. This number use FooterReference style which you can redefine by addFontStyle method. Default value for this style is array ('superScript' => true);

5.9 Checkboxes

Checkbox elements can be added to sections or table cells by using addCheckBox.

```
$section->addCheckBox($name, $text, [$fontStyle], [$paragraphStyle])
```

- \$name Name of the check box.
- \$text Text following the check box
- \$fontStyle See "Font style" section.
- \$paragraphStyle See "Paragraph style" section.

5.10 Textboxes

To be completed

5.11 Fields

To be completed

5.12 Line

Line elements can be added to sections by using addLine.

```
$linestyle = array('weight' => 1, 'width' => 100, 'height' => 0, 'color' => 635552);
$section->addLine($lineStyle)
```

Available line style attributes:

- weight Line width in twips
- color Defines the color of stroke
- dash Line types: dash, rounddot, squaredot, dashdot, longdash, longdashdot, longdashdotdot
- beginArrow Start type of arrow: block, open, classic, diamond, oval
- endArrow End type of arrow: block, open, classic, diamond, ovel
- width Line-object width in pt
- height Line-object height in pt
- flip Flip the line element: true, false

5.9. Checkboxes 25

26 Chapter 5. Elements

Styles

6.1 Section

Below are the available styles for section:

- pageSizeW Page width in twips (the default is 11906/A4 size)
- pageSizeH Page height in twips (the default is 16838/A4 size)
- orientation Page orientation, i.e. 'portrait' (default) or 'landscape'
- marginTop Page margin top in twips
- marginLeft Page margin left in twips
- marginRight Page margin right in twips
- marginBottom Page margin bottom in twips
- borderTopSize Border top size in twips
- borderTopColor Border top color
- borderLeftSize Border left size in twips
- borderLeftColor Border left color
- borderRightSize Border right size in twips
- borderRightColor Border right color
- \bullet borderBottomSize Border bottom size in twips
- borderBottomColor Border bottom color
- headerHeight Spacing to top of header
- footerHeight Spacing to bottom of footer
- gutter Page gutter spacing
- colsNum Number of columns
- colsSpace Spacing between columns
- breakType Section break type (nextPage, nextColumn, continuous, evenPage, oddPage)

6.2 Font

Available font styles:

- name Font name, e.g. Arial
- size Font size, e.g. 20, 22,
- hint Font content type, default, eastAsia, or cs
- bold Bold, true or false
- italic Italic, true or false
- superScript Superscript, true or false
- subScript Subscript, true or false
- underline Underline, dash, dotted, etc.
- strikethrough Strikethrough, true or false
- doubleStrikethrough Double strikethrough, true or false
- color Font color, e.g. FF0000
- fgColor Font highlight color, e.g. yellow, green, blue
- bgColor Font background color, e.g. FF0000
- smallCaps Small caps, true or false
- allCaps All caps, true or false
- rtl Right to Left language, true or false

6.3 Paragraph

Available paragraph styles:

- align Paragraph alignment, left, right or center
- spaceBefore Space before paragraph
- spaceAfter Space after paragraph
- indent Indent by how much
- hanging Hanging by how much
- basedOn Parent style
- next Style for next paragraph
- widowControl Allow first/last line to display on a separate page, true or false
- keepNext Keep paragraph with next paragraph, true or false
- keepLines Keep all lines on one page, true or false
- pageBreakBefore Start paragraph on next page, true or false
- lineHeight text line height, e.g. 1.0, 1.5, ect...
- tabs Set of custom tab stops

28 Chapter 6. Styles

6.4 Table

Table styles:

- width Table width in percent
- bgColor Background color, e.g. '9966CC'
- border (Top|Right|Bottom|Left) Size Border size in twips
- border (Top|Right|Bottom|Left) Color Border color, e.g. '9966CC'
- cellMargin (Top|Right|Bottom|Left) Cell margin in twips

Row styles:

- tblHeader Repeat table row on every new page, true or false
- cantSplit Table row cannot break across pages, true or false
- exactHeight Row height is exact or at least

Cell styles:

- width Cell width in twips
- valign Vertical alignment, top, center, both, bottom
- textDirection Direction of text
- bgColor Background color, e.g. '9966CC'
- border (Top|Right|Bottom|Left) Size Border size in twips
- border (Top|Right|Bottom|Left)Color Border color, e.g. '9966CC'
- gridSpan Number of columns spanned
- vMerge restart or continue

6.5 Image

Available image styles:

- width Width in pixels
- height Height in pixels
- align Image alignment, left, right, or center
- marginTop Top margin in inches, can be negative
- marginLeft Left margin in inches, can be negative
- wrappingStyle Wrapping style, inline, square, tight, behind, or infront

6.6 Numbering level

- start Starting value
- format Numbering format bullet/decimal/upperRoman/lowerRoman/upperLetter/lowerLetter
- restart Restart numbering level symbol

6.4. Table 29

PhpWord Documentation, Release 0.12.0

- suffix Content between numbering symbol and paragraph text tablspacelnothing
- text Numbering level text e.g. %1 for nonbullet or bullet character
- align Numbering symbol align leftlcenterlrightlboth
- left See paragraph style
- hanging See paragraph style
- tabPos See paragraph style
- font Font name
- hint See font style

30 Chapter 6. Styles

Templates processing

You can create a .docx document template with included search-patterns which can be replaced by any value you wish. Only single-line values can be replaced.

To deal with a template file, use new TemplateProcessor statement. After TemplateProcessor instance creation the document template is copied into the temporary directory. Then you can use TemplateProcessor::setValue method to change the value of a search pattern. The search-pattern model is: \${search-pattern}.

Example:

```
$templateProcessor = new TemplateProcessor('Template.docx');
$templateProcessor->setValue('Name', 'Somebody someone');
$templateProcessor->setValue('Street', 'Coming-Undone-Street 32');
```

It is not possible to directly add new OOXML elements to the template file being processed, but it is possible to transform main document part of the template using XSLT (see TemplateProcessor::applyXslStyleSheet).

See Sample_07_TemplateCloneRow.php for example on how to create multirow from a single row in a template by using TemplateProcessor::cloneRow.

See Sample_23_TemplateBlock.php for example how clone block of TemplateProcessor::cloneBlock and delete a block of text using TemplateProcessor::deleteBlock.

Writers & readers

8.1 OOXML

The package of OOXML document consists of the following files.

- _rels/
 - .rels
- docProps/
 - app.xml
 - core.xml
 - custom.xml
- word/
 - rels/
 - * document.rels.xml
 - media/
 - theme/
 - * theme1.xml
 - document.xml
 - fontTable.xml
 - numbering.xml
 - settings.xml
 - styles.xml
 - webSettings.xml
- [Content_Types].xml

8.2 OpenDocument

8.2.1 Package

The package of OpenDocument document consists of the following files.

- META-INF/
 - manifest.xml
- Pictures/
- content.xml
- · meta.xml
- · styles.xml

8.2.2 content.xml

The structure of content.xml is described below.

- office:document-content
 - office:font-facedecls
 - office:automatic-styles
 - office:body
 - * office:text
 - · draw:*
 - · office:forms
 - · table:table
 - · text:list
 - · text:numbered-paragraph
 - · text:p
 - · text:table-of-contents
 - · text:section
 - * office:chart
 - * office:image
 - * office:drawing

8.2.3 styles.xml

The structure of styles.xml is described below.

- office:document-styles
 - office:styles
 - office:automatic-styles

- office:master-styles
 - * office:master-page

8.3 RTF

To be completed.

8.4 HTML

8.3. RTF 35

Recipes

9.1 Create float left image

Use absolute positioning relative to margin horizontally and to line vertically.

```
$imageStyle = array(
    'width' => 40,
    'height' => 40,
    'wrappingStyle' => 'square',
    'positioning' => 'absolute',
    'posHorizontalRel' => 'margin',
    'posVerticalRel' => 'line',
);
$textrun->addImage('resources/_earth.jpg', $imageStyle);
$textrun->addText($lipsumText);
```

9.2 Download the produced file automatically

Use php://output as the filename.

```
$phpWord = new \PhpOffice\PhpWord\PhpWord();
$section = $phpWord->createSection();
$section->addText('Hello World!');
$file = 'HelloWorld.docx';
header("Content-Description: File Transfer");
header('Content-Disposition: attachment; filename="' . $file . '"');
header('Content-Type: application/vnd.openxmlformats-officedocument.wordprocessingml.document');
header('Content-Transfer-Encoding: binary');
header('Content-Transfer-Encoding: binary');
header('Cache-Control: must-revalidate, post-check=0, pre-check=0');
header('Expires: 0');
$xmlWriter = \PhpOffice\PhpWord\IOFactory::createWriter($phpWord, 'Word2007');
$xmlWriter->save("php://output");
```

9.3 Create numbered headings

Define a numbering style and title styles, and match the two styles (with pStyle and numStyle) like below.

```
$phpWord->addNumberingStyle(
    'hNum',
    array('type' => 'multilevel', 'levels' => array(
        array('pStyle' => 'Heading1', 'format' => 'decimal', 'text' => '%1'),
        array('pStyle' => 'Heading2', 'format' => 'decimal', 'text' => '%1.%2'),
        array('pStyle' => 'Heading3', 'format' => 'decimal', 'text' => '%1.%2.%3'),
    )
);

$phpWord->addTitleStyle(1, array('size' => 16), array('numStyle' => 'hNum', 'numLevel' => 0));

$phpWord->addTitleStyle(2, array('size' => 14), array('numStyle' => 'hNum', 'numLevel' => 1));

$phpWord->addTitleStyle(3, array('size' => 12), array('numStyle' => 'hNum', 'numLevel' => 2));

$section->addTitle('Heading 1', 1);

$section->addTitle('Heading 2', 2);

$section->addTitle('Heading 3', 3);
```

9.4 Add a link within a title

Apply 'HeadingN' paragraph style to TextRun or Link. Sample code:

```
$phpWord = new \PhpOffice\PhpWord\PhpWord();
$phpWord->addTitleStyle(1, array('size' => 16, 'bold' => true));
$phpWord->addTitleStyle(2, array('size' => 14, 'bold' => true));
$phpWord->addFontStyle('Link', array('color' => '0000FF', 'underline' => 'single'));
$section = $phpWord->addSection();

// Textrun
$textrun = $section->addTextRun('Heading1');
$textrun->addText('The ');
$textrun->addText('The ');
$textrun->addLink('https://github.com/PHPOffice/PHPWord', 'PHPWord', 'Link');

// Link
$section->addLink('https://github.com/', 'GitHub', 'Link', 'Heading2');
```

9.5 Remove [Compatibility Mode] text in the MS Word title bar

Use the Metadata\Compatibility\setOoxmlVersion(n) method with n is the version of Office (14 = Office 2010, 15 = Office 2013).

```
$phpWord->getCompatibility()->setOoxmlVersion(15);
```

38 Chapter 9. Recipes

Frequently asked questions

10.1 How contribute to PHPWord?

• Improve the documentation (Sphinx Format)

10.2 Is this the same with PHPWord that I found in CodePlex?

No. This one is much better with tons of new features that you can't find in PHPWord 0.6.3. The development in CodePlex is halted and switched to GitHub to allow more participation from the crowd. The more the merrier, right?

10.3 I've been running PHPWord from CodePlex flawlessly, but I can't use the latest PHPWord from GitHub. Why?

PHPWord requires PHP 5.3+ since 0.8, while PHPWord 0.6.3 from CodePlex can run with PHP 5.2. There's a lot of new features that we can get from PHP 5.3 and it's been around since 2009! You should upgrade your PHP version to use PHPWord 0.8+.
